

Erratum and other post-submission notes on
Computing Philosophical Logics. Developing an Automated Proof Calculator
for Propositional and Quantified, Classical and Non-Classical Logics
by Andrei Dobrescu, as of 12.09.2026

This document contains an erratum and other (not yet explicitly stated) post-submission notes on my master thesis, submitted at (and accepted by) the Faculty of Philosophy, University of Bucharest, during the July 2025 session, coordinated by professors Mircea Dumitru and Marian Călborean, as well as its associated software project and the prior prototype software project.

Erratum:

1. On page 5, figure 2, chapters *13 Free logics* and *15 Variable domain modal logics* were implemented in the software, at the time of thesis submission, only as positive free logic, not negative free logic (as wrongly stated). After that, I did implement the proof systems of both chapters in both their negative and positive forms.
2. On page 7, soundness and completeness definitions are wrong, since they should be about validity, not truth. A logic's soundness means that if any well-formed formula (or formal argument) is provable in the proof system, then it is valid. Completeness means that every well-formed valid formula (or formal argument) is provable in the proof system.
3. On page 15, the (*) note from the bottom of the page should be as well about validity, not truth. It should state: *Initially $\neg(P \equiv Q)$, $P \vdash \neg\neg Q$ was assumed as a valid inference. This led to contradiction on all tree branches. It can't be right, thus $\neg(P \equiv Q)$, $P \vdash \neg Q$ is valid.*
4. On page 22, the universal quantifier rule should fetch all instantiated objects from the tree branch (regardless of their type, i.e. of their source variable name), it should not fetch them in a filtered manner. At the time of submission, the software did implement the rule as stated in the thesis. Afterwards, I fixed the software to fetch all objects.
5. On page 26, various formulas should not be enclosed by quotes (""), since those are not citations. This was just an unfortunate choice of characters.
6. On page 27, figure 26 should show a tableau that disproves that formula in Łukasiewicz fuzzy logic, since both tree branches are non-contradictory. Both systems of inequalities, the one from the left branch, and the one from the right branch, do have solutions.
7. On page 34, it is insufficiently stated what it means that *Most solutions generated by the software were compared with Louis Barson's solutions*. Louis did publish solutions to all problems from the first part of the book (chapters 1 to 11). While implementing proof systems of those chapters as software, I did use those solutions as a reference guide to software correctness. The software does not output the same proof trees as his (and neither should). Rather, for each problem, the software outputs the same status (proved / disproved) as claimed on his solutions. The expected status of the problems was also used as an input of an automated test suite. Assuming his solutions are correct and assuming the software correctly implements the proof systems, this assures (not theoretical, but practical) software correctness, on solving the problems from the first part of the book.
8. On page 34, the URL of the running project is incomplete. It should be <https://andob.io/incl>
9. On page 42, fuzzy logic negated imply rule should be as the one from page 25.

Other post-submission notes

The master thesis, its associated software project and the prior prototype project are the result of my work, except where reference is explicitly made to other authors. This can be easily verified by checking the thesis Turnitin report and the project(s) git commit history(ies). Any gratitude statement from the beginning of thesis towards other persons shall not be interpreted as more than that. In particular, Marian's contribution as logic professor, (non-remunerated) project manager, research seminar presentation partner and *de facto* thesis supervisor should not be interpreted as more than that.

The master thesis, the code of the associated software project and the code of the prior prototype project were written under a zero Generative AI usage policy. This was not explicitly stated in the master thesis, as academic rules at the time of submission required the author to mention AI usage, if any of it was the case, and not the converse.

My official contact email addresses are andreidobrescu832@gmail.com, usingvirtualbox@gmail.com and (only up until around january 2026) andrei.dobrescu@neurony.ro and andrei.dobrescu1@s.unibuc.ro. Marian's official contact email addresses are mc@filos.ro and marian.calborean@opti.ro. If you receive an email from other email address, claiming to be one of us, you should consider that an impersonation.

The thesis describes the project at <https://github.com/andob/INCL-automated-theorem-prover>, available on my personal GitHub <https://github.com/andob>. It is a free and open source project, licensed under the Apache license on my name (and it was like that from its inception). I did not use and I will not use the software for commercial purposes, neither will I change the licensing model to a commercial licensing model.

Prior to that, there was a prototype project, developed by myself at Marian's Logic & software 2024 elective course, available on his personal GitHub at <https://github.com/mcfilos/ls2024> and my personal GitHub at <https://github.com/andob/ls2024>. This is a free and open source project as well, licensed under the CC0 license (and it was like that from its inception; Marian was the one who did the licensing choice, on his initial commit). We did not use and we will not use the prototype software for commercial purposes, neither will we change its licensing model to a commercial licensing model.

The INCL-automated-theorem-prover project (the final project) was a complete rewrite of the ls2024 prototype. I developed the initial prototype in Kotlin, implementing the proof systems of the first 3 chapters of Graham Priest's *Introduction to Non-Classical Logic From if to is 2nd edition* (the book). I developed the final project in Rust, under a completely new architecture, implementing the proof systems of all chapters of the book (except for chapters 10 and 24 Relevant logics). All development process can be easily verified by checking the public git commit history on both the prototype project and the final project.

Archives were made on archive.org, softwareheritage.org as well as my personal BitBucket.

A snapshot of the git commit histories (took with git log) can be found below.

Git commit history

On the initial Kotlin prototype (<https://github.com/andob/ls2024>, <https://github.com/mcfilos/ls2024>)
